

Vyoma Digital

Linux LMS Client Installation Guide

LINUX SETUP GUIDE

1. Install .NET Runtime (if not already)

```
sudo apt update
```

```
sudo apt install -y dotnet-runtime-8.0
```

2. Unzip the files to /opt/lmsproxy or your desired directory

3. Move to Deployment Directory

```
cd /opt/lmsproxy/cmd
```

4. Configure IP Routing using iptables

Run:

```
chmod +x setup-port-forwarding.sh
```

```
sudo ./setup-port-forwarding.sh
```

5. Run LMS Proxy in Background

```
nohup sudo ./LMSPProxy > /var/log/lmsproxy.log 2>&1  
&
```

Or set it up as a systemd service (ask if needed).

Verification

After setup:

- From a browser or curl, hit any product URL (e.g., <http://yourdomain.com/yourproduct>) and verify that the LMS Proxy intercepts it.
- Check logs for validation and forwarding steps.

For questions or automation scripting help, email us or go to [Support page](#) on our website.
